Off-Grid Power Systems

① Power Source

Gathers Energy from your renewable energy source:

Solar

Wind

Micro Hydro

② Power Board

Converts, conditions & distributes power throughout the house or building as required. Also controls battery charging & system monitoring.

③ Storage

Power from the source is stored in a battery bank. The size of the battery bank determines the amount of power available to your home.

Big or Small ...

Renewable energy systems can be configured to meet that needs of many applications:

- RV or Marine
- Seasonal or weekender cabins
- Full time family home
- Full sized estate
- Agricultural applications
- Remote camps, and more.

The best source of Renewable Energy will vary from site to site. Multiple sources can also be combined to maximize year round production.

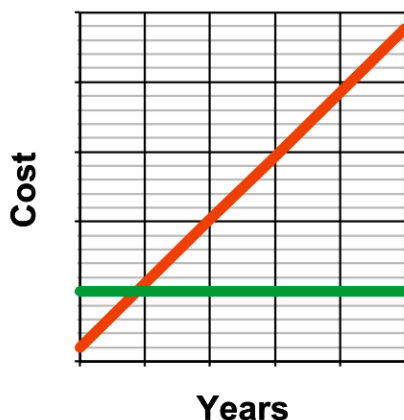

Energy Cost Security

Purchasing Renewable Energy requires a different mindset when compared to fuel burning systems. You are paying up-front for the energy produced during the entire lifetime of the system (which can be 25 years or more). Once the system is paid for, the energy it produces comes free from a non-polluting source.

Cost Comparison: Renewable Energy vs. Fuel Burning Generator

Even in a modern energy efficient home, the total cost of fuel over a 25 year period could be more than triple the up-front cost of a Renewable Energy System. And that's if fuel prices stay at today's rates over the entire time - how likely is that?

*Where will fuel costs be 10 years from now?
Protect yourself by being proactive!*

Generator and Fuel

- Fuel prices will continue to increase
- Initial purchase cost & fuel costs
- Ongoing maintenance
- Noisy & emits greenhouse gasses

Renewable Power

- Complete system, low maintenance
- Clean, non-polluting energy source
- Quiet and comfortable

Not sure where to start? Call us today to discuss which type of Renewable Energy System best suits your site!
